IRISH GARDENS AND GARDENING BEFORE CROMWELL
1 – Detail from a bird’s-eye view of Belfast, dated 1685, showing Sir Arthur Chichester’s house at Belfast with surrounding gardens and courts
BARRYS COURT LECTURE SERIES

Barryscourt Castle is a fine 16th-century tower-house at Carrigtwohill, Co Cork. The Barryscourt Trust was established in 1987 with the aim of conserving, enhancing and developing the heritage potential of the castle.

In 1996, the Barryscourt Trust instituted a bi-annual series of lectures on Medieval Ireland. These will deal with aspects of medieval history, archaeology, art and architecture, and will be delivered by scholars specialising in the period. The lectures will be published individually and in compilation form.

Irish Gardens and Gardening before Cromwell

Terence Reeves-Smyth
Tully Castle: view of the early 17th-century-style garden created in the castle's bawn
INTRODUCTION

Considerable variation existed in the form and function of Irish gardens during the centuries prior to the 1600s, and although the range of plants was largely restricted to European varieties, gardens were far from colourless or uninteresting. Culinary and medicinal plants predominated, but from medieval times, and perhaps even before, gardens were perceived not just in purely utilitarian terms, but also as places of leisure. Thus, physic gardens, orchards and even kitchen gardens were often designed for recreation as well as utility. The idea of the pleasure garden as an art form came fully to prominence in late Tudor and Jacobean Ireland, when plants were increasingly appreciated for their own sake and gardens were designed for ornament, amusement and as a means to indicate status or social achievement. Continental Renaissance ideas, exemplified in the use of terracing, statuary and other architectural features within coherent and symmetrical garden layouts, were well established by 1641 when Ireland was plunged into war. In the years that followed, there was little opportunity for gardening, and further developments ceased until after the Restoration of 1660.

Throughout their development from early times to the mid-17th century, Irish gardens were confined within enclosures. Like a picture in a frame, physical boundaries were considered an integral part of a garden's layout; walls, banks, hedges and fences were all employed, and these served to keep livestock and people out and to provide
much needed shelter for the plants within. Garden enclosures were not unique to Ireland, but the frequently unsettled conditions of the country no doubt contributed to their prevalence; indeed, at times they also functioned as part of the defensive network relating to a manor or castle.

Enclosure boundaries are a feature of early gardens that may be expected to leave some sort of imprint in the archaeological record, while path layouts, flower beds, basins and other features can also leave traces in various forms. The value of analytical field survey and excavation in investigating such relict features has been fully demonstrated in recent decades, and garden archaeology is now an established discipline in Britain and elsewhere. Undoubtedly, the most obvious and identifiable relict gardens date from the 1660 to 1740 era, when very structured, extensive and geometrical layouts predominated, but there are some good survivals from the pre-Cromwellian period. An example is the early 17th-century garden at Dunluce Castle, county Antrim, where flights of terraces and raised flower beds are preserved as upstanding earthworks in permanent pasture. The quality of survival in this case owed much to the castle being deserted within decades of the garden’s creation, although this is unusual as most of Ireland’s great houses of this era either survived or were later rebuilt on or near the same site. Consequently, the associated gardens were invariably altered or swept away by later activities – often a succession of garden layouts, each reflecting the changing fashions of its period. Such multi-period sites can be archaeologically rewarding in themselves, but ultimately our best source of information must derive from the minority of gardens abandoned at early stage.

In the long term, much of our knowledge of pre-17th-century gardens will inevitably derive from programmes of fieldwork and excavation, but to date the potential of garden archaeology in Ireland has yet to be fully realised. Meanwhile, heavy reliance must be placed upon the historical record. Unfortunately, although documentary sources contain plenty of references to gardens and orchards, this by itself is of limited value beyond indicating that garden-making was widely practised in Ireland from earlier medieval times. More exact information on layout, content and size is scarce, due to a paucity of surviving records and to illiteracy among gardeners prior to the 1700s. Instructions were given verbally, garden catalogues were rarely compiled, plant acquisitions were often by exchange, and those purchased were seldom specified individually on bills. The difficulties are exacerbated by the backwardness of social history research in Irish medieval studies and by the fact that a great deal of manuscript material remains unpublished. Nonetheless, much can be inferred from the available records, while comparative English material can be used in the generalities of the field.

PREHISTORIC GARDENING

Horticulture is rarely if ever mentioned, let alone discussed, in the context of Irish or British prehistory, but the probability is high that some form of gardening existed at this time. Unfortunately, despite the wealth of evidence for cultivation from pollen studies, field systems and ard marks, we still know surprisingly little of the range and relative importance of the plants grown in prehistory. Part of the problem derives from a lack of waterlogged deposits - the most valuable class of evidence - and our consequent dependence upon carbonised remains, supplemented by seed impressions on pottery. From these sources we know that naked and hulled barley, rye and primitive wheats, such as emmer and einkorn, were grown in the Irish Neolithic, but the range cultivated may have been more numerous than presently known as relatively few sites have been extensively sampled for charred remains. Furthermore, the food plants likely to be preserved in carbonised form are inherently biased towards those crops which needed to be parched over or in the domestic fire as part of the processing before consumption. Most edible greens, notably root vegetables and brassicas, are unlikely to leave any identifiable trace, and although legumes (peas and beans) sometimes have to be kiln-dried or parched before storage, this may have been unnecessary in the Neolithic or Bronze Age if summer temperatures were appreciably higher than today.

It could be argued that many of the plants cultivated in continental Europe during prehistory were probably also grown in Ireland, provided the environmental conditions were favourable. Trade and cultural links extended over wide areas, and besides, it is unlikely that new colonisers would have abandoned their basic complement of seed stocks. As legumes accompanied cereals in the early advance of agriculture, their early arrival in Ireland is likely. The vine may likewise have had an early appearance, as grape pips, most probably Vitis sylvestris, have been discovered in early Neolithic levels as far north as Sweden, as well as in England. Alexanders (Olusatrum, Petroselinum alexandrinum), beet (Beta) and coriander (Coriandrum) go back to the Iron Age or earlier, and there is also continental evidence for use of the common goosefoot or fat hen (Chenopodium album) as a vegetable, and for the deliberate cultivation of other arable weeds, notably Pale Persicaria (Polygonum lapathifolium) and Gold of Pleasure (Candina satina). Leeks, celery and carrots may also have been grown in Ireland during prehistory, but unfortunately, being so highly perishable, they will always be difficult to detect. However, the wild leek (Allium babingtonii), which grows today in the west of Ireland and is related to species found in south-west Europe, might be descended from such early imports.

The value of plants to make and dye cloths was widely appreciated
in prehistory. Flax (Linum usitatissimum), which was harvested for its oil-rich seeds (linseed) and its bast fibres to make linen, was cultivated in Ireland from at least the early Bronze Age, and appears to have been widespread by early Christian times.\textsuperscript{14} We have no direct evidence for dyes on Irish prehistoric levels as yet, but the sophistication of jewellery and personal ornaments in both the Bronze Age and Iron Age indicates a wealthy and fashion-conscious society which probably used clothing colours to denote the wearer's rank, as was done in early historic times.\textsuperscript{15} In the English Iron Age, woad (Isatis tinctoria) was used as a blue and possibly pink dye,\textsuperscript{16} while other dye plants known to have been cultivated from European prehistoric contexts include weld (Reseda luteola) and Aaron's rod (Verbascum thapsus) for yellow, field madder (Sherardia arvensis) for pink, and safflower (Carthamus tinctoria) for orange.\textsuperscript{17} Such plants would probably have been grown in special gardens rather than alongside the arable.

4 – Woad (Isatis tinctoria)
THE EARLY CHRISTIAN PERIOD

It is clear that the Romans, during their four centuries of domination of Britain, were responsible for introducing a wide range of fruit, vegetables and flowers, as well as new methods of horticulture. Some seeds and plants no doubt arrived in Ireland during the period of empire, but it was not until the 5th century, with the arrival of Christian missionaries, that any real semblance of Roman gardening techniques and plants were adopted here. The church brought Ireland into direct contact with the Romanised world, introducing, among other things, literacy and a knowledge of continental lifestyles and values. In the monasteries, which multiplied in number during the 6th and 7th centuries, classical literature was avidly read, including texts on botany, agriculture and horticulture, notably Pliny’s *Naturalis Historia* and the specialist works of the *De re Rustica*. Horticultural expertise was undoubtedly also brought by some of the scholars who flocked from the continent to the Irish monastic schools and by monks returning from their European travels as missionaries or ‘pilgrims of grace’. The gardening interest of some of these monks is illustrated by the story of Saint Fiachra, a Donegal nobleman, who travelled to France in the 7th century and founded a monastery deep in the forests of Breuil near Meaux. Here he created a garden so fine that he has since been regarded as the patron saint of gardeners.

The early Irish monasteries took horticulture seriously in order to meet the demands of their self-sufficient lifestyles and to satisfy their communal or penitential dietary emphasis on vegetable rather than meat products. The size of their gardens has yet to be established, but they were almost certainly located within the termens or boundaries of the *monasteria*. Typically, these enclosures took the form of a curvilinear outer vallum or embankment, with an inner, eccentically placed smaller one. The church and graveyard occupied the inner precinct, while the outer zone would have contained the fenced gardens and orchards, with industrial activity areas near the perimeter, all interspersed with the monks’ cells.

Modern excavation of these ecclesiastical enclosures in Ireland is very limited, but extensive work has been undertaken on a number of sites in south-west Scotland (Dalriada), where early Irish monasticism also flourished. At Whithorn in Galloway, one such *monasterium* produced clear botanical evidence for the cultivation of both medicinal and culinary herbs from the 6th century. Among the medicinal assemblages here, one contained elder (*Sambucus nigra*), hemlock (*Conium maculatum*) and woundwort (*Stachys arvensis*), while another included species with properties that were particularly appropriate to digestive problems, such as chickweed (*Stellaria media*), dog rose (*Rosa canina*), mustard (*Brassica nigra*), coriander (*Coriandrum sativum*) and dill (*Anethum graveolens*).
While archaeological evidence remains sparse, the early written tracts are quite unambiguous about the existence of gardening both in the monasteries and among the population at large. These sources derive principally from the law-texts, annals, saints’ lives, poetry and sagas, and mostly date from the 7th to the 9th centuries. They make it clear that a prosperous farm often had an enclosed garden (lubgort) situated outside the les. A whole range of garden plants are mentioned, and indication is given that their cultivation sometimes required specialist skills; for example, we are told that one of the seven officers of the church was a gardener (lubgortóir) and that on Iona, and presumably other monasteries, there was an officer whose duties was that of gardener (hortulanus).

Vegetables, fruit and herbs were cultivated, and particular attention was apparently given to those with medicinal properties. The law tract ‘Bretha Crólige’, which seems to have formed part of the Senchas Már, states that ‘no person on sick maintenance is entitled in Irish law to any condiment except garden herbs (lus lubgort) for it is for this purpose that gardens (lubgort) have been made’. One plant often mentioned as a condiment for invalids, and apparently much cultivated, was leafy celery (imus / Apium graveolens secalinum), believed to prevent sickness ‘and does not stir it up, prevents thirst and not infect wounds’.

Identification of plant varieties from the early sources can cause confusion in some instances, but it is evident that the most frequently mentioned vegetable in the texts, cainnenn, was a bunching or shallot type of onion. The leek (borflus) was also commonly grown, possibly as a substitute for garlic, and can probably be identified with the variety Allium babingtonii found in western Ireland today. Cabbage (braisech) featured in monastic diets, sorrel (samhadh / Rumex acetosa) was used in salads, while skirrets (cerrbacán / Sium sisarum), chives (foltchép / Allium schoenoprasum) and kale (meacain murrathaig) were also cultivated, as were peas and beans. Other food plants not apparently mentioned, but likely to have been grown, include parsnip, beet, lettuce, radish and vervain, while in addition to dill and coriander mentioned above, monastic herb gardens probably also included such umbellifers as fennel, alexanders, parsley and lovage.

An important horticultural development of the period was the appearance of orchards (aballgort) containing apples, plums and possibly other fruit. Apples do not breed true from seed and most cannot be reproduced from suckers or cuttings, so in common with many other fruit trees, their cultivation demands the vegetative propagation of clones by grafting. The technique appears to have had its origin in the far east, possibly western China, and to have arrived in the Mediterranean around 1000 BC or earlier. The Romans, who employed a wide range of grafting methods, notably cleft grafting, root grafting and budding, are usually
credited with introducing the art to northern Europe. Earlier claims have been made on the basis of apple finds in prehistoric contexts, but these have proved to be the result of confusion between the small native European wild 'crab apple' (Malus sylvestris) and larger domesticated varieties. As the evidence stands at present, it would appear that the technique of grafting, and with it cultivated apples, plums and possibly pears, were most likely carried to Ireland by the monks in the 5th or 6th centuries.

The early written sources make a clear distinction between native sour wild apples (fiaduball) and sweet cultivated apples (ubla cumrae). Indeed, one text apparently recognises the existence of different varieties of cultivated apples, and heavy fines were imposed for stealing them. Many of the monasteries probably had orchards; at Tallaght, the Culdees were allowed to eat apples on festival days with their bread so long as 'each man's share of apples was three or four, if they be big ones; if they chanced to be small, each man's share was not to exceed the number of five or six.' The garden plum (Prunus domestica), which like the apple was propagated by grafting, was also cultivated at the time (áirne cumra), but neither the pear nor the damson seem to be mentioned in early texts, though they were widely grown in contemporary Europe.

The much-quoted statement that Ireland had 'no lack of vines', written by the Venerable Bede (673-735) towards the end of his life, may not be such an exaggeration as some would believe. Wine was indispensable for celebrating the sacrament, and the monks consequently needed a regular supply. Some importation was likely, particularly once the Norse towns were established in the 9th and 10th centuries, but transporting wine can be difficult and many monasteries were in remote locations. Considering the degree of self-sufficiency practised by the monasteries, and the probable mildness of the climate at the time, it is more than likely that the grapevine (Vitis vinifera) was often cultivated by the monks themselves.

Some of the garden plants of the Early Christian period were grown for industrial purposes. Flax or lin (Linium usitatissimum) was widely cultivated, particularly for linen tunics (léine), which were worn under the cloak. Teasal (Dipsacaceae saúvus) was possibly grown for fulling, and hemp (Cannabis sativa) for making rope fibre. The latter is an Asiatic plant, which was introduced to northern Europe by the Romans and was known to the Vikings. Many dye stuffs are derived from plants, most notably woad (Isatis tinctoria), which is often mentioned in the early Irish sources (glaisen) and was clearly widely grown. In one tale, the Queen of Tara is represented as having her own woad garden (glaisengort), while an 8th-century law-text gives details of some of the processes employed to obtain the blue dye. There are also references to the cultivation of r iod,
which Professor Kelly has convincingly shown was the dye-plant true madder (*Rubia tinctorum*), a native of south-west Asia. The roots of madder were used to obtain alizarin (Turkey red), and was widely available from Roman times. The onion (*Allium cepa*) was probably used for yellow dye, as was possibly fairy flax (*Linum catharticum*) and dyer's rocket or weld (*Reseda luteola*). Aside from cloths, a wide selection of dyes were needed for the illuminated manuscripts, some of which were undoubtably of vegetable origin, though research has shown that many mineral-based dyes were also imported for the purpose, such as red lead, verdigris, orpiment and ox-gall.

It seems likely that some garden plants were introduced with the establishment of permanent Norse settlements from the 10th-century. Excavations in Dublin and Waterford have produced considerable archaeobotanical assemblages, bringing evidence of town diets and of plants grown in and around urban areas. Fruit and nuts were eaten, while some of the herbs and vegetables found include leafy celery (*Apium graveolens*), carrot (*Daucus carota*), fennel (*Foeniculum vulgare*), radish (*Raphanus raphanistrum*), mustard (*Brassica nigra*) and other members of the brassica (cabbage) family. The evidence also suggests that fat hen (*Chenopodium album*) and some members of the *Polygonum* genus (persicaria and knotweeds) were deliberately cultivated for food. Some of the 'weeds' found may have been grown for medicine, including chickweed, mallow, hemlock, henbane and woundwort. As one might expect, the assemblages are very similar to those found at York, though at York the examination of vegetable tissue in addition to just the analysis of seeds allowed such plants as leek (*Allium porrum*), woadwaxen (*Genista tinctoria*), Scandinavian clubmoss (*Diphasium complanatum*) and true madder to be identified – plants which were probably also present in Dublin at this time. Most of these urban gardens, which appear to have been fairly rudimentary, were located behind the street houses in small plots where they jostled for space with sheds or byres and cesspits.
5 - Anemones
from Parkinson's Paradisus, 1629
THE MEDIEVAL PERIOD

Our knowledge of medieval gardens and gardening has been revolutionised in recent decades, thanks in large measure to the brilliant scholarship of the late John Harvey, whose classic work on the subject was published in 1981. By piecing together a mosaic of information from many different sources, Harvey has enabled us to visualise gardens of the period in a way that had not been previously possible. He also established that medieval gardens shared similar characteristics across northern Europe, with a similar range of plants, so despite the fragmentary nature of the Irish evidence, we do have a very clear picture of the kind of gardens that the continental monasteries and the Norman settlers brought to Ireland in the 12th century.

Harvey and subsequent researchers have emphasised the central role of the monasteries in developing and disseminating horticultural expertise across Europe in the Middle Ages. In Ireland, where the continental houses spread far beyond the limits of Norman expansion, their role was enormously important, and remained so until the Dissolution in the 16th century. With their emphasis on self-sufficiency and on a disciplined, corporate lifestyle, the monasteries practised a highly efficient system of agricultural, water and woodland management, and appreciated the importance of land drainage, soil enrichment, coppicing and crop rotation. A knowledge of trees and plants was encouraged through well-stocked monastic libraries, often containing laboriously hand-copied herbs, and an exchange network of seeds and cuttings flourished among the monasteries, notably in the Cistercian order. Herbs were grown for medicinal and culinary purposes, flowers for church decoration and religious festivals, and fruit and vegetables for guests and the community itself, which, at times, ate virtually no meat. For the medieval monks, gardening also had an important spiritual dimension: they believed that Adam and Eve’s disobedience in the Garden of Eden – the Doctrine of the Fall of Humanity – meant that one avenue of seeking association with God was through gardening.

It is clear from the Monastic Extents of 1540 to 1541 and other documents that monastic gardening in Ireland tended to be focused within the area of the precincts. These enclosures have been somewhat neglected in Irish archaeological research, though all the continental houses in Ireland adopted them, including the friaries. The concept stemmed from the Rule of St Benedict, where clearly defined, self-contained precincts were advocated to ensure that the monks could be spared the temptation to roam abroad and encouraged to perform their necessary tasks within the spiritual sanctuary.
The monastery should, if possible, be so arranged that all necessary things, such as water, mill, garden and various crafts, may be within the enclosure, so that monks may not be compelled to wander outside it, for that is not at all expedient for their souls.\

A small minority of Irish precincts were delimited by walls, notably Kells (county Kilkenny) and Athassel (county Tipperary), but the majority were enclosed by earthen banks and ditches. In their heyday, these enclosures, particularly those of the Benedictine and related establishments, were busy and crowded places, far removed from the quiet and tranquil places they are today. Some idea of their appearance can be gauged from the early 9th-century monastic plan of St Gall and from the 16th-century plan of St Vedast’s Abbey, both depicting a whole series of gardens of all shapes, functions and sizes, jostling for space in the precincts amidst domestic and industrial buildings. Analogous images are found in monastic accounts, for example, Norwich Cathedral Priory and Beaulieu Abbey in Hampshire. In Ireland, the mid-14th-century Register of the Hospitaler’s Priory at Kilmainham similarly shows a proliferation of vegetable gardens, herb gardens, pleasure gardens and orchards scattered within the outer and inner precincts. These were wedged in amidst a motley array of structures, such as the brewhouse, dairies, forges, carpenters’ shops, stables, granaries, barns, storage and food-processing buildings. There were kitchen gardens, hostiliars’ gardens, obedientiary gardens and numerous garden

6 – Borage (Borago officinalis) in the medieval-style physic garden created in the grounds of Grey Abbey, county Down
plots attached to the many *camerae* for permanent guests and others within the Kilmainham enclosure. Many other monasteries also had infirmary gardens and some had almoners' gardens. All of these would have been enclosed in some way, either with paling or wattle fences and in some cases with stone walling. Thorn hedges were probably not a feature of the precinct, but were commonly used to enclose manorial gardens of the period, such as those on the Earl of Norfolk’s Leinster estates.

In some cases, the size of the monastic precinct was not big enough to accommodate all the gardens and orchards, and some had to be located outside. Precinct areas mostly varied from one to twelve acres, though some of monastic enclosures in the Dublin suburbs, notably St Mary’s Abbey, were much larger. Areas under productive garden obviously varied according to the size and demands of each monastery, but it is worth noting that the great country houses of the 19th century, whose requirements had much in common with medieval monasteries, needed between three and five acres of intensively managed kitchen gardens. The Cistercian abbey of Beaulieu had about ten acres of garden to support a community of 120 brethren and 250 hired workers, so on this basis we could estimate that an abbey such as Graignamanagh, with fifty monks and sixty laybrothers, would have needed at least three acres of gardens and orchards – more than half the precinct area. With the decline in the size of monastic communities in the 14th century, it is likely that garden acreages also fell.

As the location of the various precinct gardens was probably determined by the layout of the monastic buildings, the kitchen gardens would be expected to lie close to the cook house. Practicality meant that grid-like plans were usually followed, as depicted in the St Gall plan, with raised beds, supported by boards or low wattle edgings, flanked by paths, which often doubled as irrigation channels. Most of the vegetables cultivated in the monasteries, and by the population at large, were pottagers, so-called because they were cooked in a large metal pot to make pottage soup – the basic hot dish of the Middle Ages, which was usually eaten alongside the staples of bread and ale. The main ingredients included leeks, onions, chibols, shallots, porrets, peas, broad beans, leafy beets and colewort leaves, flavoured with parsley, garlic and hyssop, and often including some meat or fish. Many other herbs and seasonings were also grown for use in pottage or eaten raw as salad, but root vegetables did not come into general use until the late Middle Ages, when carrots, parsnips, skirrets,rapes and turnips were all commonly added to pottage.

A good idea of the range of vegetables and herbs available in Ireland during the Norman era can be obtained from a poem written in doggerel verse called the 'Feate of Gardening', dating to about 1300 and attributed to Master Jon Gardener. This treatise, which is the first coher-
ent account of horticultural techniques in English, was probably composed
in England rather than Ireland, but both surviving manuscripts have Irish
origins and include references to 'all the herbs of Ireland'. It contains sec-
tions on trees, grafting, viticulture, the onion family, coleworts, parsley
and herbs generally, including a long list with seasonal advise and a con-
cluding section on saffron. There are plants for medicinal and ornamental
use, but the main basis of the list are potherbs, salads and sweet herbs,
mainly for use in pottage or as flavouring. Some of these included alex-
anders, borage, cress, water cress, fennel, groundsel, lettuce, smallage, nepp
(Nepeta cataria), orach (Atriplex and related genera of Chenopodiaceae),
radish, spinach and tansy. Principal sweet herbs and condiments include
calamint, coriander, dill, dittander (Lepidium), hyssop, lavender, mints,
sage, savory, thyme and wood sorrel. In all, one hundred herbs and vege-
tables are listed, excluding the probable varieties involved in many entries —
a considerable number if compared with what was probably available in
Ireland a few centuries earlier. A large number of the plants listed by Jon Gardener had medicinal
properties, and many of these would have been grown in the monastery's
infirmary garden, where they could be used by the resident phisicus or
medicus. Poisons such as mandrake, hemlock, henbane and opium poppy
were normally included in the physic garden, so a grid layout with raised
beds was invariably used to ensure their segregation from plants which
may have been used in cooking. Diet and health were, in fact, closely
linked in medieval medicine, and fruit and vegetables were thus common-
ly included in the infirmary garden. Herbs and flowers such as lilies, roses,
wormwood, polypody, dill, camomile, flag irises and saffron might be dis-
tilled or dried to make compound medicines, salves or tonics that could be
used for general ailments, to treat blood letting or to protect against plague
or disease. These gardens also served as recreational areas for the con-
valescent monks, and often assumed an ornamental aspect with tunnel
arbours, trellises and perhaps a small pond for growing aquatic plants such
as waterlilies, which were used medically. Considering the important role
some Irish monasteries played in caring for the sick, it is likely that a num-
ber of infirmary gardens covered large areas. The one at Westminster
Abbey occupied two acres, so we should be careful not to assume that the
physic garden was a tiny plot tucked away behind the infirmary.

Physic gardens were often the location of beehives — a standard fea-
ture of monasteries and manors alike. Bees have been 'cultivated' in
Ireland from pre-Christian times and have had a long association with gar-
dening. They pollinated herbs and flowers, produced honey — used for
sweetening, for mead and medication — and also beeswax for candles, writ-
ing tablets, seals and adhesives. Loghives appear to have been used by the
Early Christian monks who were noted beekeepers, while wickerwork
skeps were in general use by the Norman period; skeps of coiled straw seem not to have become widely employed in Ireland until the Tudor period. There are references to ‘bee-towers’ or ‘honey-towers’ for keeping hives in medieval Ireland, but it seems likely that most hives were kept in open-fronted shelters – a practice that continued until the early 19th century.

Beehives were sometimes located in the orchard, as were dovecotes, which are often mentioned in medieval accounts. Most orchards were probably regularly laid out in a grid pattern and could be extensive in size; in 1303 the manor of Santry, county Dublin, had two hundred apple trees and one hundred pear trees, implying an area of at least three acres, while the manor of Old Ross in Wexford was producing nine bushels of apples for sale in the 1280s. Many of the monasteries could boast several orchards: at St Thomas’s Abbey (Dublin) there were eight, Greatconnell (Kildare) had six, and Inistioge (Kilkenny) had five. Some of these may have been ‘cemetry orchards’ – an age-old association that is depicted on the St Gall plan as rows of trees flanking the monks’ graves.

Undoubtedly, apples predominated in Irish orchards, most likely including varieties of Costards, Pearmain and Bitter-sweets, the latter being for cider. The most widely appreciated pears of the period included Wardens, Sorells, Caléols and Gold Knopes, all of which were usually cooked and put into preserves, puddings and pies. Dessert pears may have been comparatively rare, though there is one apparent reference to a Bon Chrétien in the prior’s garden of St John’s Priory, Kilkenny. Plums and cherries were also grown, and other fruits might have included filberts, walnuts, medlars and perhaps even figs in some sheltered places. The favourable climatic conditions that existed prior to the 14th century would certainly have suited figs, and, indeed, grave-vines, for which there is some evidence in the form of both vineyards and winepresses, despite the fact that Ireland was known to be importing a great deal of wine from France during this period.

Orchards were greatly valued in the Middle Ages for their blossom, and many were utilised as recreation grounds, complete with paths, flowers and arbours. Conversely, pleasure gardens often included flowering fruit trees as part of their design. Ornamental gardening was an important feature of the period, particularly in the monasteries, where gardens were frequently created for prayer and meditation, known as ‘paradises’, or for entertainment purposes. Pleasure gardens also existed in the secular world, many, no doubt, being located within the bawn of the castle or manor. The Continental and English evidence demonstrates such gardens followed a fairly basic formula, being usually small, enclosed, square or rectangular plots with raised beds and much ‘carpenter’s work’ in the form of trellises, fences and arbours. The area was often quartered with sanded or gravelled paths, leading to a central feature such as a pool or perhaps a bay
tree (*Laurus nobilis*) — a symbol of constancy and a popular evergreen. Turfed seats, sometimes enriched with small flowers such as camomile and thyme, frequently edged the garden perimeter or occupied suitable corners, perhaps in association with potted plants, which were widely used in monasteries and elsewhere at this time. Another striking characteristic was the large amount of woodwork employed in the form of garden furniture, fences, railings, trellises or tunnel arbours, the latter sometimes enclosing the area like a cloister. These would have been wreathed with trained apple trees or climbers, such as vines or eglantine (*Rosa rubiginosa*), while the garden beds would have contained shrubs, flowers and herbs, the most popular being highly scented plants like roses and lilies. Both white roses (*R.alba*) and red roses (*R.gallica* and *R.gallica* 'Officinalis') were grown in Ireland during this period, and, together with lilies and irises, were particularly in demand in the monasteries to decorate the church. Chaplets and garlands of roses were also regularly worn by the clergy on festival days until the Reformation. Indeed, the church often stipulated the payment of one or more roses, sometimes specified as red roses, as the annual rental for small holdings.

Depending on their size, gardens of the period often included lawns. Invariably these were studded with flowers, such as sweet violets, periwinkles, primroses, daisies, cowslips and wild strawberries — the so-called 'flowery medes'. For Albertus Magnus, writing in 1260, 'nothing refreshes the sight so much as fine short grass', and it was for precisely this reason that the monastic cloister garths contained lawns. Indeed, except for a few very occasional references to roses, lilies, pines and junipers, all of which had symbolic values, there is no evidence for the growing of anything other than turf in the cloister. The colour green was considered to have a tranquillising effect, as Hugh de Fouilly remarked:

'The green turf in the middle of the cloister refreshes encloistered eyes and their desire for study returns. It is truly the nature of the colour green that it nourishes the eyes and preserves their vision.'

Isolated trees may have occasionally been planted in Irish monastic cloisters, though the famous yew at Muckross grows in the accumulation of debris which fills the court, and was therefore planted after the friars had departed. There is some evidence for tree-planting in the medieval period, but the subject has yet to be fully explored and lies outside the scope of this paper. However, it must be said that the orthodox view that woodland planting did not take place until the 17th century is difficult to support in the light of our current understanding of underwood and timber management in Anglo-Norman Ireland.

THE ELIZABETHAN AND EARLY STUART PERIOD

The gardens that evolved in Britain, France and the Low Countries during the 16th century remained fundamentally medieval in character. Features such as quartered enclosures, raised beds, tunnel arbours and trellises all continued, while the late-medieval vogue for knots or geometric patterns defined by perennial plants was developed into a major garden component, particularly in England. From the time of the dissolution of the monasteries however, an undercurrent of change was slowly revolutionising garden design. The emergence of a new wealthy elite promoted the creation of larger and more magnificent gardens, while Italian Renaissance ideas, which flooded into Britain following the accession of James I, encouraged houses and gardens to be designed as single units. In addition, exotic plants began arriving back in increasingly large quantities from newly discovered parts of the world, and gardening skills were improving, notably in the breeding of new flower strains with bigger double blooms. Above all, printed books started to make their mark on horticulture, such as Hill’s Profitable Arte of Gardening (1568), The Gardeners Labyrinth (1577) and Gerald’s The Herbal (1595). These and other publications made information on the form of gardens and their contents available to an increasingly wider audience, leading to greater standardisation in taste and design.
Ireland must have had many gardens during the Elizabethan and early Stuart periods; at least 3,500 are noted in the Patent Rolls of James I, despite the fact that only a small minority of the compilers considered them worthy of inclusion. Most were undoubtably plots for vegetables, but the great magnates had fine pleasure gardens and some of these were of considerable size. The tenth Earl of Ormonde’s Tudor house at Carrick-on-Suir, built from 1565, had extensive courts on the north and west sides, no doubt filled with fashionable gardens, while the Desmond Roll of 1583 recorded that Newcastle West, county Limerick, had a garden with two fish ponds in the main enclosure and another three-acre garden and orchard outside the curtain walls. Nearby, at Askeaton Castle, the Earls of Desmond also had a half-acre garden, ‘triangular in plan, in which a fishpond lies to the south, all of which is enclosed with a stone wall’. A bird’s-eye view of Askeaton in Pacata Hibernia depicts this garden as being laid out in regular square plots, and while we have no further information, it is probable that each of these plots contained knots with delimiting wooden rails incorporating images of Geraldine heraldry.

The only visual representation of a garden during this period in Ireland is a bird’s-eye view of the Master’s garden at Trinity College, Dublin, in the 1590s. This depicts a large plot divided into compartments of different designs – a closed knot of diamonds and rectangles containing flowers, another with some form of emblematic design, one incorporating roses, and an open knot, presumably with coloured sands. There are no planting details, but in 1605 Harry Holland signed a deed allowing him ‘the use and possession of the College’s five gardens and the great orchard’, being permitted to take half of ‘all the herbs, lavender, roses and fruit of the trees’. He was required to grow turnips, cabbages, parsnips, carrots, artichokes, onions, leeks ‘and other things as they shall need for 30 persons or 8 messes as the cook shall think good’. Little mention is made of the garden flora, but a wide range was commonly available by this time, such as wallflowers, jasmine, lilac, syringa, species of iris and lily, hyacinth, tulip and double carnations. Edmund Spencer refers to many of these in his poetry, and no doubt grew them in his garden at Kilcolman, county Cork. His contemporary and friend, Sir Walter Raleigh, introduced a number of his own plants, including the sweet-smelling yellow wallflower from the Azores and the Assane cherry from the Canaries, both of which he established first at Assane and later at Dromona. In his garden at Myrtle Grove in Youghal, Raleigh also grew the American tobacco plant, but is perhaps best remembered for his role in introducing the potato, which had such rapid and remarkable success in Ireland.

Raleigh was a beneficiary of the land settlements resulting from the expansion of government control in Ireland at this time – a policy that brought waves of colonists, undertakers and administrators in ever-increas-
ing numbers during the first four decades of the 17th century. It was land owners such as these, the so-called ‘new English’, who were the most eager to adopt the Italian Renaissance fashion for designing gardens in strict symmetrical relationship with the house, often with terraces, stairways, waterworks and sculpture. An early example was Sir Nicholas Malby’s great garden from the 1580s, laid out in front of his new mansion at Roscommon Castle. For Malby and other members of his class, gardens were a very visible means of proclaiming newly found status and wealth. Many of the ‘old English’ also saw themselves as upholders of civilised (i.e. anglicised) standards in Ireland and were willing to create gardens in the new style, but most appear to have done so with rather less ostentation than the new English. The more traditionally minded Gaelic landowners however, appear to have largely rejected Renaissance ideas, and while we know comparatively little of their gardening, it is likely many continued to create late-medieval style gardens until the 1640s. As always there were exceptions, and much may have depended upon a family’s wealth, geographical location and intermarriage with other socio-political groups.

The richest and most successful of the new settlers in Ireland during this period was Richard Boyle, the Great Earl of Cork, whose garden creations at Youghal and Lismore are documented in his diaries. His house within the town walls of Youghal, ‘The College’, which lay beside Raleigh’s

9 – Youghal, county Cork: view of Boyle’s lower garden terrace looking towards the Sacred Heart Convent, formerly Richard Boyle’s residence in the town
old home at Myrtle Home, was flanked by two massive terraces, 160 yards long, cut into the hillside overlooking the town c.1612-14. The grounds occupied an area of about six acres, all typically enclosed behind stone walls with circular bastions. The terraces are depicted on a map of Youghal in Pacata Hibernia,113 where they appear to be shown as a series of knot gardens, no doubt incorporating stairways, balustrading and statues, while some of the plants included a consignment of roses from Bristol in 1613.114 The garden walls and terracing at Youghal are still present, as are those at Lismore Castle, which must count as the most impressive garden remains from this period in Ireland. The Lismore garden comprises a three-acre rectangular enclosure with enclosing high stone walls and turrets built in 1626, and contains a raised walk at one end and a series of terraces, stairways and a central path aligned on the town’s medieval cathedral.115 The planting details are unknown, but we can assume it contained topiary, globes, standard bays, pots of carnations and some statuary, all incorporated into elaborate knots, and perhaps even a fashionable parterre de broderie of clipped box which could be admired from the terraces above.

As at Lismore, pleasure gardens of the early Stuart period frequently functioned as part of the outer defences of the manor, often symmetrically flanking both the front forecourt, or bawn, and the house itself, thus allowing the gardens to be enjoyed from the main reception room win-
dows. Many of these enclosures had round turrets in the corners, which, in addition to their defensive role, probably served as viewing stations for the gardens. Indeed those at Galgorm, county Antrim (c.1620), and at Ballygalley Castle, county Antrim (c.1625), were converted into summer houses during the 19th century. At Rathcliff, county Longford, a network of rectangular towers protected the garden, and at Rosemount, county Down (c.1634), gun bastions were used. There was also a bastion in the corner of Sir Thomas Phillip's pleasure garden at Limavady, as shown on Thomas Raven's 1622 drawing. Covering about a third of an acre to the north of the castle, this garden is depicted as having been subdivided into three large plots, each apparently delimited by topiary, with an arbour in the centre. The drawing also shows an enclosed kitchen garden and orchard located further away to the east, overlooked by a circular dovecote but outside the main castle defences.

Some of the fortified gardens covered considerable areas. At Mallow Castle, the two gardens and orchard flanking the bawn covered four acres, and at Newtownards, the network of walled courts with flankers built by the Montgomery family in the 1630s occupied seven acres. At Lennagh, county Clare, the great house of the O'Briens, there were walled enclosures covering eleven acres, described in 1639 as comprising 'walled gardens, fish ponds, a pair of summer houses and a brick tower'. Much still survives, notably an eight-acre enclosure which contains a brick-built summer house with classical niches, traces of fish ponds, a turret and a remarkable raised walk flanking the northern side of the enclosure. Walking was then a popular pastime and a number of gardens of the period were equipped with raised walks. Chichester House in College Green, Dublin, had a long, twenty-foot-wide terrace overlooking the gardens, and at Jigginstown, county Kildare, there were impressive raised walks around a large rectangular garden fronting the south side of this palatial house built by Thomas Wentworth's from 1635. As it was intended as a residence for both the Lord Deputy and the King, the garden undoubtably contained a suitably grand parterre de broderie, possibly with a central fountain. The raised walks here, from which the gardens could be admired, also had a defensive function, with their outside faces being lined with walling and brick-built turrets placed in the corners.

Earthen banks and palisades were also commonly used to protect gardens. Even William Bulkeley's fine house at Old Bawn near Dublin (c.1635), with its network of flankering courts, including a one-acre pleasure garden, was enclosed by a massive ditch. A spectacular example of gardens being fortified with earthen banks was at Birr, where Sir Laurence Parsons enclosed about two acres north-east of the bawn in 1620-29. These gardens, defended with banks, bastions and a large stone-built 'garden tower', are depicted on a 1691 map of the town, and shown then to
have contained three regimented rows of rectangular beds. Planting details are lacking, but each probably contained a knot or parterre.  

North of the gardens at Birr lay an extensive orchard enclosed by hedges. In the Birr papers there are records for the purchase of cherry trees from Croghan in 1622 and for cherry trees and plum trees from Thurles in 1625.  

Orchards were now a very important component of Irish gardens, and the number of named varieties being planted was increasing rapidly. Many were being imported from England, but Ireland was already developing its own centres for fruit cultivation, notably in Kilkenny, while the best published work on fruit for the period was written by an Irishman. The Earl of Cork had apples, pears, peaches, nectarines, apricots and cherries at Lismore, and acquired Irish stock whenever possible; for example, Daniel Sullivan of Berehaven sent him Harvey apples and Bon Chrétien and Bergamotte pears, in addition to arbutus or cane apples for his garden.
in England. Quinces, bullaces, mulberries, medlars, filberts and damsons were also available at this time, and the various fruit trees, either full or half standards, were normally planted in a quincunx, often with an underplanting of grass enriched with sweet violets, spring bulbs, strawberries and perhaps the occasional rose bush. As in medieval times, the orchard was frequently treated as a pleasure ground, with straight paths, perhaps bordered with gooseberries or common berberis, aligned upon statu-
ary, bowers or a summer house.

There were, of course, many palisaded or walled gardens of the peri-
od, which were not defensive in the military sense. At Dungiven, county Derry, the formal garden attached to the rear of Captain Doddington’s gabled house and bawn was enclosed by a plain wall without turrets. The garden here, as depicted on Raven’s 1622 plan, shows a quartered layout, with each of the four plots containing a diagonal arrangement of knots focused upon a central feature. No doubt many other such houses had similar gardens; at Monea, county Fermanagh, for example, there is clear archaeological evidence for such an enclosure, presumably originally palisated, flanking one side of the house and bawn. The gardens at Dunluce, county Antrim, which contained terraces, raised beds and a bowling green among its features, were also apparently enclosed on the landward side by a palisade.

Whereas most gardens and orchards flanked the bawn or main forti-
fied enclosure of Irish early 17th-century houses, some bawns were them-
selves large enough to accommodate gardens. Thomas Raven’s plan of Macosquin, county Derry, shows the house in the centre of a large rectangu-
lar bawn, flanked by garden courts down one side, while Sir Toby Caufield’s fine Renaissance house within the star-shaped fort of Charlemont, county Armagh (c.1622-24), was similarly surrounded by symmetrical courts, some of which almost certainly contained gardens. A plan of the fort at Monaghan, built by Sir Edward Blaney in 1614, depicts a layout of six square compartments, each with complex knots, and three rectangular fishponds, all axially aligned on the rear of the house. No doubt Blaney’s main house at Castleblaney had a similarly grand gar-
den, but the plan of this fort, like so many other surveys of the period, unfortunately did not include the gardens.

Some of the smaller plantation bawns of this period might have contained gardens. At Tully, county Fermanagh, excavations in the 1970s revealed a series of cobbled paths, which were subsequently used as the base for a garden reconstruction. However, most such bawns probably served as forecourts, and, as such, would have been treated in a manner typical of entrance courts in England throughout the 17th century. Normally this involved a wide path down the centre, a cross path and perimeter paths, the latter often running close to the walls. The square or
rectangular areas created by this arrangement were occupied, not with knots or parterres, but with grass *plats*, and at the more pretentious houses these *plats* would have been delimited with topiary, with perhaps a statue or urn in the centre of each. Few, if any, flowers would have been included in what was a very masculine affair intended to project a sense of dignity to the house.\textsuperscript{137} The front court at Portumna (c.1620), undoubtably the most dramatic bawn-court in Ireland,\textsuperscript{138} was almost certainly treated in this way, as were, in all probability, other bawns of the period, such as Burntcourt (county Tipperary) and Coppinger's Court (county Cork).

The use of grass to make hand-cut designs in gardens, known as *Parterres à l'anglaise* or *gazon coupé*, was apparently starting to become popular at this time.\textsuperscript{139} An amusing reference to something like this form of gardening comes from Sir William Brereton's visit to the Lord Primate of Ireland's palace in Drogheada in 1635, where he found a:

>'pretty neat garden and over against the window in the gallery end, upon a bank, these words in fair letters are written: 'O MAN, REMEMBER THE LAST GREAT DAY. The bank is bare, the proportion of the letters is framed out in grass.'\textsuperscript{140}

In the same year, Brereton also visited other houses and gardens, such as Lord Conway's manor at Lisburn, but it was Joymount in Carrickfergus and Belfast Castle which impressed him most. Both houses belonged to Sir Arthur Chichester, the Lord Deputy of Ireland from 1605 to 1616, and both reflected his considerable wealth, status and power.

Joymount, named in honour of Chichester's patron Lord Mountjoy, was built between 1610 and 1618. It is depicted on Phillip's map of Carrickfergus of 1685 (with inset view) as a fine three-storey 'stately house' with mullioned windows and projecting bays, approached from the south over a drawbridge and through a gatetower with domed corner turrets leading axially into a walled forecourt.\textsuperscript{141} East of the house Brereton found:

>'a graceful terrace and a walk before the house as at Denton, my Lord Fairfax's house. A fine garden and mighty spacious orchards and as they say have a goodly store of fruit. I observed on either side of this garden and twixt the garden and orchard a dove house placed one opposite the other, a most convenient place for apricockes.'\textsuperscript{142}

From contemporary maps it can be established that this 'fine garden' was a rectangular half-acre plot bordering the east side of the house. It was divided by paths into four sections, with a circle, perhaps a basin and fountain, in the centre. A pair of dovecotes symmetrically flanked each side of this garden, with an orchard to the north and more gardens to the south. Just east of the garden and outside the town walls lay a large five-acre 'bordure d'arbre', probably an orchard, crossed and recrossed by vistas of trees in a cruciform plan.\textsuperscript{143} In 1683 Richard Dobbs noted that he had seen
12 – A plan and inset view (c.1685) of Sir Arthur Chichester’s house and gardens at Joymount, Carrickfergus, built between 1610 and 1618
‘cherries ripe (at Joymount) in May’, and likewise had seen ‘very good musk-melons here about 1658 and ’59’.144

Brereton also admired Chichester’s ‘dainty stately house’ at Belfast and his ‘dainty orchards and gardens and walks planted out’. This was a tall, multi-gabled brick building begun about 1611, and, like Joymount, enjoyed the protection of the town defences – a factor which helped it to fully develop an extensive network of surrounding walled courts. These are depicted in a remarkable bird’s-eye view of Belfast in 1685, where the house is shown to occupy the centre of a large walled court, flanked by walled gardens and orchards on the east, south and south west sides.145 They contained among other things a ‘cherry garden’, an ‘apple garden’, a bowling green and arbours. There are also references to the growing of strawberries, currants and gooseberries, and to the payment of wages for rolling, cleaning, weeding and wheeling in ashes and cinders for the paths.146 Further details are sadly lacking, but a garden of this quality would undoubtedly have contained grass plats, knots and embroidered parterres, as well as statuary, topiary and waterworks – in short, all the trappings that epitomise Renaissance gardening in the period before the outbreak of war in 1641.

EPILOGUE

In October 1641 Lord Barrymore was hosting a dinner at Castle Lyons, his great house in county Cork, itself noted for its fine gardens and orchards, when it was announced to the disbelieving guests that rebellion had broken out in Ulster.147 Within a year, those at the table, including the Great Earl of Cork and Lord Muskerry, would be fighting on different sides in what proved to be the most destructive and bloodiest war in Ireland’s history. Over the next ten years, numerous great houses built across the country during the early Stuart period would be destroyed and their gardens abandoned, many of which would remain in ruins, never to be rebuilt. Ornamental gardening came to a halt, though vegetable gardens undoubtedly continued; the population still had to eat and gardens were probably a more reliable source of food than the more distantly located and less defendable fields of arable and livestock.

In the years following Cromwell’s campaign, enough stability returned to the country for ornamental gardening to begin again. At Monkstown, county Dublin, the stern regicide, General Ludlow, laid out a fine garden ‘famous for thy apples and thy pears, for turnips, carrots, lettuce, beans and peas’.148 Also at this time, William Petty, who arrived in Ireland on leave from the University of Oxford, attempted in 1653 to set
up a physic (botanic) garden in Dublin in co-operation with another army physician, Benjamin Worsley. However, while new plants, especially fruit trees, began arriving into Ireland, it was not until the Restoration of 1660 that gardening was once again energetically embarked upon. In this new dawn, gardens were ultimately divested of their old enclosures and the symmetry of the house and garden was extended into the landscape through long perspectives. The concept of the ‘designed landscape’ had arrived, and with it a new age in garden history.

Notes and References

1 In historical perspective, gardening is understood to mean the culture of plants of any kind, while the term 'garden' denotes a plot where plants are grown. See J Harvey, *Mediaeval Gardens* (Batsford, London, 1981), pp1-2
3 No plan of the earthworks are published; see M Meek, *Dunluce Castle* (Environment and Heritage Service, Belfast, 1995)
5 This is changing. In recent years many garden archaeological surveys (all unpublished) have been undertaken as part of the Great Gardens of Ireland Restoration Programme. In Northern Ireland progress has been made with the creation of a comprehensive Parks and Gardens Inventory and Register within the NI Monuments and Buildings Record (Environment and Heritage Service, Belfast). Garden excavations have taken place at Antrim Castle and Kylemore, but garden traces have incidentally been recognised on other excavated sites, viz. Barryscourt.
6 The all too common failure to publish translations of manuscripts is also detrimental to research – most of us have better ways to occupy our time than grappling with Latin dictionaries.
8 A Fenton, ‘Net-drying, pot drying and graddening: small scale drying and processing techniques’, *Sage och sed*, yearbook of the Royal Gustav Adolfs Academy (1982), pp86-106
10 No pulses have yet been found in Irish prehistoric contexts, Monk 'Macroscopic remains', p34. However, in England, the Celtic bean (*Vicia fabia celtica*) has been identified in late Neolithic levels, and the pea (*Pisum sativum*) has been recovered in Bronze Age contexts.
14 Monk, 'Macroscopic remains' p34; V Hall, 'The historical and palynological evidence for flax cultivation in mid-Down', Ulster Jn. of Archaeology, 52 (1989), pp5-9
16 JH Hurry, The Wood Plant and its Dye, ed. AR Horwood (Oxford, 1930); JH Betty, 'Cultivation of woad', Textile History, 9 (1978), pp112-17. Unlike many dyes, woad requires no mordant, but an alkali such as potash is necessary to make it soluble.
19 From the macrofossil evidence, we can be sure that the Romans in Britain had field bean (Vicia faba); leek (Allium porrum); pea (Pisum sativum); alexanders (Smyrnium olusatrum); coriander (Coriandrum sativum); dill (Anethum graveolens); fennel (Foeniculum vulgare); white mustard (Sinapis alba); parsley (Papaver somniferum); rue (Ruta graveolens) and savory (Satureja sp.). Fruits included sour cherry (Prunus cerasus); medlar (Mespilus germanica); black bulberry (Morus nigra) and plum (Prunus domestica).
20 The cultivation of walnut (Juglans regia) is doubtful. The pernicious goutweed or ground elder, better known to Irish gardeners today as bishop's weed (Aegopodium podagraria), was introduced to Britain by the Romans as a vegetable, and probably also arrived in Ireland during Early Christian times. By 1380 it was known as 'the devil of the garden'; see JH Harvey, 'Botanical Incunabula', Historic Gardens Review, summer (1998), pp21-5.
21 In chronological order, the four works of the De re Rustica are those of Cato (234-149 BC), Varro (116-27 BC), Columella (mid-1st century AD) and Palladius (writing AD c.380-95). Except for Cato, these authorities were widely read in monasteries throughout the Middle Ages.
22 Originally just the patron saint of French gardeners, he also founded the monastery of Ullard in Kilkenny, and died in AD 670; see ES Rohde, The Story of the Garden (London, 1932), p60.

Professor Kelly gives the translation of the old Irish Corrbacán as skirret. However, some garden historians would argue that skirrets were not introduced until medieval times. Other than bulbs, the skirret is the first recorded root crop in England, being grown by the abbot of Westminster in 1273. It originally hailed from China. However, the water parsnip (Sium latifolium) is native to these islands.

Cultivated fruit trees that usually demand grafting include apples, pears, plums and cherries. Those that can be cultivated without grafting include sycamore figs, olives, date palms, vines and pomegranates. The latter group appear much earlier in the European archaeological record.

56 The most comprehensive analysis of medieval Irish monasticism is R Stalley, The Cistercian Monasteries of Ireland (Yale University Press, London, 1987)

57 NB White (ed.), Extents of Irish Monastic Possessions 1540-1541 (Stationery Office, Dublin, 1943); see also, Irish Record Commission, Irish Patent Rolls of James I (Stationery Office, Dublin, 1966)

58 See Stalley, Cistercian Monasteries, pp176-78, for a brief discussion of the precinct in an Irish context. Excavations in Ireland have been very focused upon limited areas, mostly within the claustral ranges. For a useful summary, see TB Barry, The Archaeology of Medieval Ireland (Methuen, London, 1987). Recently it has been accepted that the precinct needs to be the focus of future study; KD O'Conor, The Archaeology of Medieval Rural Settlement in Ireland, Discovery Programme monograph (Stationery Office, Dublin, 1998), pp142-44.

60 In some cases the medieval precinct incorporated Early Christian termon boundaries; see A Hamlin, 'A recently discovered enclosure at Inch Abbey, County Down', Ulster Jn. of Arch., 40 (1977), pp85-8. Security became increasingly important by the 14th
century, and many of the walled precincts belong to this period. The largest and most impressive walled precinct in Ireland was St Mary's Abbey in Dublin (c. 27 acres or 11ha).

64 Obedientiary gardens probably became more common in the later Middle Ages. Abbots and priors often had their own gardens, as at St Mary's and at Newgate (Hospital of John Baptist) in Dublin, Pat. Rolls James I, Pat. 8-2-lxvii, and Monastic Extents, p55. At Graiguenamanagh, the Abbot's garden was damaged by flooding in 1475; G Carville, Norman Splendour: Duiske Abbey (Belfast, 1979), p 91

65 For example, stone walls were noted at Armagh (Peter and Paul) priory, Pat. Rolls James I, Pat. 16-ii-530-vii; at Duleek some garden walls were plastered, E St John Brooks, 'Fourteenth century monastic estates in Meath', Jn. Roy. Soc. Antiq. Ir., 83 (1952), pp 140-49

67 As at Fermoy, county Cork, Hogg's, county Dublin, and Fethard, county Tipperary; see Pat. Rolls James I, Pat. 9 (4) xxviii; Pat. 13 (3) iii; Pat. 15 (3) viii. Urban monasteries often had garden plots scattered within and outside the town, as at Wexford; see Pat. Rolls James I, Pat. 4 (1) xxxii.

68 Precinct areas are given in Monastic Extents and Pat. Rolls James I. It is important to recognise that these areas are mostly medieval acres or 'great measure' (hm), equivalent to about 2½ statute acres. 'Small measure' is also occasionally employed; this is the same as the Irish plantation acre of 1.6 statute acres. The English or statute acre was only occasionally used in Ireland until the 19th century; see J Mills, 'Notices on the Manor of St. Sepulchre, Dublin in the fourteenth century', Jn. Roy. Soc. Antiq. Ir., 19 (1889), p 35, n 2.

69 Beaulieu accounts of 1269, see Hockey (1975)

71 JH Harvey, 'Vegetables in the Middle Ages', Garden History, 12 (1984), pp 89-99

72 Peas and beans from gardens were eaten green, those from the fields were used dry. Ireland was a major producer and exporter of field peas and broad beans in the Norman period.

The following plants are included in Jon Gardener’s lists: ‘Adderstongue’ (cuckoo-pint); agrimony; alexanders; avens; betony; ‘bigold’ (corn marigold); borage; brooklime; bugle; calamint; camomile; campion; caraway; centaury (lesser); clary; colewort; comfrey; coriander; cowslip; cress; water cresses; daffodil; bruisewort (daisy); dill; ‘dittany’ (dittander); horseheal (elecampane); f流转 (gentian); fennel; feverfew; foxglove; garlic; glasswin (flag iris); gromwell; ‘groundsel’; ‘half wood’ (bittersweet); harts-tongue; henbane; herb Robert; ‘herb Walter’; hollyhock; ‘honesuckle’ (?Melilotus); horehound (white); hyssop; langdebeef; lavender; leek; lettuce; lily; ‘liverwort’; marsh (smallage); mints; motherwort (mugwort); mouse-war; nepp; Oculus Christii (wild clary); onion; orach; orpine; parsley; pellitory; peony; periwinkle; pimpernel; ribwort (plaintain); waybread (plantain); polyopathy; primrose; radish; ‘red mayweed’; roses (red and white); rue; saffron; sage; St John’s Wort; sanicle; savory (winter and summer); ‘scabious’; senevy (mustard); southernwood; ‘spearwort’; ‘spearwort’; ‘spinach’; stitchwort; strawberry; tansy; teasel (wild); thistle (‘Wolf’s’); thyme; tutsan; valerian; vervain; violet; wallwort; waterlily; woodruff; hindheal (wood sage); wood sorrel; wormwood; yarrow. See Harvey, The first English garden book, pp93-100. The absence of rosemary (introduced into Britain c.1340) helps to date the list; see JA Harvey, ‘Medieval plantmanship in England: the culture of rosemary’, Garden History, 1 (1972), pp14-21.

Some monasteries had a series of separate infirmaries; Lexington in 1228 mentions some Cistercian houses having one for the monks, one for the laybrothers and another for the poor; Stalley, Cistercian Monasteries, p173.

Dr Nelson has tentatively identified deadly nightshade (Atropa belladonna), and the opium poppy (Papaver somniferus) on decorated floral motifs at Corcomroe Abbey. Lily of the valley (Convallaria majalis) was also identified; Stalley, Cistercian Monasteries, p274, n40.

NG Siraisi, Medieval and Early Renaissance Medicine (University of Chicago Press, Chicago, 1990)

The 12th-century papal prohibitions against monastic involvement in lay medicine appears to have had little effect in Ireland, where some monasteries treated lay patients as well as their own brethren until the dissolution. Medieval lay medicine in Ireland tended to be a hereditary practice, at least in rural areas. For background on monk-physicians, see EA Hammond, ‘Physicians in medieval English religious houses’, Bull. Hist. of Medicine, 32 (1958), pp105-20; DA Amundsen, ‘Medieval canon law on medical and surgical practice by the clergy’, Bull. Hist. of Medicine, 52 (1978), pp23-43.

‘A monastic ‘physic garden’ has recently been recreated at Grey Abbey in county Down by the Environment and Heritage Service. It contains many plants that one might expect to find in such a garden, but in size must be regarded only as a miniature version of the real thing.

Kelly, Early Irish Farming, p108-13; E Crane, The Archaeology of Beekeeping (London, 1983); E Crane, ‘Bee bop a loo bole’, Arch. Ir., 6, no. 21 (1992), pp15-17

There was a 40 ft. high bee-tower at Mellifont, and another at Clonmore, county Louth, 50 ft. high, built c.1230. The latter had a series of floors, each with louvred windows to allow bees to come and go. JK Watson, Bee-keeping in Ireland: A History (Glendale, Dublin, 1976).

Some monasteries had several dovecotes or culvert houses. Mellifont had four within its precincts; Pat. Rolls James I, Pat. 3 (1) xvii. Most Irish medieval dovecotes were probably wooden structures with thatched roofs, but a handful of stone-built beehive-
type examples survive, notably Kilcooley and Shanagolden (both in county Tipperary) and Ballybeg (county Cork).

Archaeology has the potential to verify this, as it has done at Dunstable Priory; see S Moorhouse, ‘Ceramics in the medieval garden’ in Brown (ed.), Garden Archaeology, p115.

HS Sweetman (ed.), Calendar of Documents relating to Ireland 1302-1307 (London, 1887; reprinted 1974 by Kraus, Leichtenstein), p86, item 255

Hore, A History of the Town and County of Wexford, p25

Monastic Extents, pp2, 170, 185

Landsberg, The Medieval Garden, pp36-8

The various sorts of pippin didn’t become popular until the 15th century. Cider may never have been the popular drink in Ireland that it was in England at this time, but cider presses are occasionally mentioned in Irish medieval documents; for example, there was one at Kilsaran Manor in Louth; see D Maclvor, ‘The Knight’s Templar’s in County Louth’, Seanchas Ardmhacha, 4 (1960-62), pp72-91.

Figs feature in Irish documents of the period, notably in kitchen accounts, viz. Kells Priory in 1382 and the Priory of the Holy Trinity, Dublin, in 1338; NB White (ed.), Irish Monastic and Episcopal deeds AD 1200-1600 (Stationery Office, Dublin, 1936), p76; J Mills (ed.), Account Rolls of the Priory of the Holy Trinity, Dublin, 1337-1346 (Dublin, 1891). Both figs and walnuts have been found in medieval archaeological contexts in Dublin; see Mitchell, Archaeology and Environment, p25.

A vineyard is mentioned as part of the manor of Old Ross (see Hore, A History of the Town and County of Wexford), while in 1228 a winepress was noted by Lexington, probably at Jerpoint; Stalley, Cistercian Monasteries, pp45, 173. For a useful summary of the Irish wine trade, see O’Neill, Merchants and Mariners, pp44-57.

Moorhouse, ‘Ceramics in the medieval garden’ in Brown (ed.), Garden Archaeology, p102-6, figs. 9 (2, 3, 4). For turf-topped seats, see Landsberg, The Medieval Garden, pp51-3; Noble, Farming and Gardening, p10, n66

This can hardly be understated, for most illustrations of medieval gardens depict work, often a great deal, while documents speak the same story. Irish medieval gardens are unlikely to have been any different, especially as there was no shortage of timber or joiners.

For garden flowers of the period, see T McLean, English Medieval Flowers (Barrie & Jenkins, London, 1989); M Innes and C Perry, Medieval Flowers (Kyle Cathie, London, 1997)

Usually to be paid on the feast of the Nativity of St John the Baptist (in June). For example, see E Curtis (ed.), The Calender of Ormonde Deeds (1172-1350), pp155, 163, 164, 186, 192, 225, 235, 237, 266, 277, 289, 298, 300, 301, 305, 313, 324, 339, 340, 345, 349, 356, 367, 382, 408, 450, 464, 568, 612, 629; Sweetman (ed.), Calender of Documents relating to Ireland 1302-1307, p81; White (ed.), Irish Monastic and Episcopal Deeds AD 1200-1600, pp75-6 (A57/99)

Landsberg, The Medieval Garden, pp35-6; Noble, Farming and Gardening, p14, n96, 97, 98

U Eco, Art and Beauty in the Middle Ages (Yale, London, 1986)

H Leask, ‘Muckross’, Jn. Cork Hist. Arch. Soc, 45(1940), pp85-96. The yew here was probably planted in the late 17th century, when the friary was linked to the gardens at Muckross house by an avenue of elms. Young noted it had a diameter of two feet in
1776.

109 H Jager, ‘Land use in medieval Ireland: A review of the documentary evidence’, Ir. Econ. Soc. Hist., 10 (1983), pp51-65; A O’Sullivan, ‘Woodmanship and the supply of underwood and timber to Anglo-Norman Dublin’ in C Manning (ed.), Dublin and Beyond the pale: Studies in Honour of Patrick Healy (Wordwell, Dublin, 1998), pp59-68. Many of the monastic ‘ash groves’ or ‘ash parks’ mentioned in accounts could be plantations. Usually these were ‘reserved for the repairs of the house’; see Pat. Rolls James I, Pat. 15 (3) iv. One of these groves lay within the precinct of St Mary’s Dublin; Pat. Rolls James I, Pat. 8 (2) lxvi. See Pat. 3 (1) xxvi; Pat. 9 (4) xxvii; Pat. 10 (2) i; Pat. 17 (iii) lxiii (Duleek).

Knot-making first emerged during the 15th century and remained fashionable until the end of the 16th century. The spaces were either filled with coloured earth or gravels (open knots) or with flowers (closed knots). Designs were commonly adopted from textiles, tapestries or pattern books.

110 R Strong, The Renaissance Garden in England (Thames and Hudson, London, 1979); J Antony, The Renaissance Garden in Britain (Shire, Princes Risborough, 1991). Both of these books concentrate upon the art historical and design aspects of gardens of this period, but without any good discussion of the plants used.

112 TJ Westropp, ‘The Desmond’s castle at Newcastle Oconyll, Co. Limerick’, Jn. Roy. Soc. Antiq. Ir., 39 (1909), pp42-55, 350-68. It may be noted that Peyton’s 1586 survey noted the ‘great orchard’ as four acres and the large garden as three acres. It lay on the west side of the bawn, occupying the site of the 18th-century walled garden.

116 JP Hennessy, Sir Walter Raleigh in Ireland (Kegan Paul, London, 1883); RH Salaman, History and Social Influence of the Potato (CUP, Cambridge, 1949; rev. ed. by JG Hawkes, 1985). The potato was recorded as growing at Grey Abbey, county Down, as early as 1606; see GH Hill (ed.), The Montgomerie Manuscripts 1603-1706 (Archer, Belfast, 1869)

117 D Murphy, ‘The castle of Roscommon’, Jn. Roy. Soc. Antiq. Ir., 21 (1890-91), pp546-86. The Essex estate papers have a drawing showing a grand avenue leading from the town to the castle. Avenues were perhaps unusual at the time, but apparently featured at a number of early Stuart gardens, as at Termon McGrath, county Donegal, Old Bawn, county Dublin, Loughmoe, county Tipperary, and Lemnagh, county Clare. The straight tree-lined avenue became a hallmark of demesne layouts in the late 17th and early 18th centuries; see T Reeves-Smyth, ‘Demesnes’ in FHA Aalen, K Whelan and M Stout (eds), Atlas of the Irish Rural Landscape (Cork University Press, 1997), pp197-205.

118 Some idea of the plants grown by the Gaelic Irish during the early Stuart period may possibly be gauged from the lists of plants prepared by Philip O’Sullivan Beare, c.1620. It includes parsley, camomile, fennel, mint, tamarisk, hyssop, wormwood, rue, mustard,
rosemary, sage, cabbage, pumpkin, radish, lettuce, parsnip, sunflower and lily. Fruit listed included apples, pears, arbutus, walnut, chestnut, pine and mulberry; see TJ O’Donnell (ed.), *Selections from the Zoilomastix of Philip O’Sullivan Beare* (Stationery Office, Dublin, 1960) appendix A.

114 Grosart, i, p243. One hundred apples trees, prunes and quinces were imported from England in 1616 for the orchard, probably located outside the main garden walls to the south-west. In the 1640s, during the siege of Youghal, the garden leadwork was melted down for shot. The lower terrace is presently the convent garden, while the upper terrace is now a field, which fortunately has survived bungalow development because of its inaccessible location beneath the town walls.

115 Grosart, iv, pp185, 206-219; Bowe, ‘The Renaissance garden’ pp75-8. The enclosure and adjacent orchards to the west are depicted on a map of Lismore c.1640; see M Girouard, ‘Lismore Castle’, *Country Life* (1964) August 6, 13. Defended garden enclosures were not unique to Ireland. There were good examples at Ware Park, Audley End and Hazelbury; see M Girouard, Robert Smythson and the Elizabethan Country House (Yale, London, 1983), p315, n28

116 One of the turrets at Ballygalley (on the road side) is an Edwardian folly; the other surviving turret is original. It overlooks a raised terrace in the garden south of the bawn. For a useful outline history of Ballygalley Castle and Galgorm Castle, see CEB Brett, *Buildings of County Antrim* (Ulster Architectural Heritage Society, Belfast, 1996), pp23; 72-3.

117 Rathcillin plan, see NLI, Ms 8646 (6); W Harris, *The Ancient and Present State of County Down* (Dublin, 1744), p268

118 Sir T Phillips, *The view of the Survey of the Plantation of the City and County of Londonderry* (PRONI, T.1576). Traces of the garden enclosures are still visible today.

122 HG Leask, ‘New light on Jigginstown’ in EM Jope (ed.), *Studies in Building History* (London, 1961), pp244-46; M Craig, ‘New light on Jigginstown’, Ulster Jn. Arch, 33 (1970), pp107-10. The house is 127 yards long with two front doors. Maurice Craig has suggested to the author that it may have been built to accommodate both the King and his Viceroy simultaneously in separate residences.

The Birr papers have a payment (1625) for 'hedging 192 perches of the hedge of the orchard' and 'for rooting the old apple trees and plum trees and throwinge downe of those banke and raisinge the ground at the south corner of the orchard', the latter reference implying the existence of an orchard at Birr in the O'Carroll days. In 1643 the orchard featured in the Birr siege when Preston dug trenches across it. These trenches are still visible in the park; McErlean and Jupp, Birr Castle Demesne, p30.

Fynes Morison writing in 1598 described Kilkenny as memorable for its pleasant orchards, and says 'of the apple we have some fine old Irish varieties not excelled by any modern introduction'; F Morison, Itinerary (London, 1617). Many well-known Irish varieties probably have their origin in the Tudor or early Stuart periods, such as the Scarlet Crofton, Irish Peach and Kerry Pippin. For a description of varieties, see Lamb, The Apple in Ireland, pp23-58.

The Fruturers Secrets (1604), later reissued as The Husbandmans Fruitfull Orchard (1608, 1609) by the mysterious Irishman, NF, of whom nothing else is known.

Townsend, The Great Earl of Cork, p296. The strawberry tree (Arbutus unedo), Ireland's first horticultural export, was 'discovered' in Kerry and sent to England in the 1580s. It was much prized by gardeners during the 17th century for its scarlet fruits (uneatable) and white flowers; see Lamb and Bowe, A History of Gardening in Ireland, p15; EC Nelson and WF Walsh, Trees of Ireland, Native and Naturalized (Lilliput, Dublin, 1993), pp86-94. The Earl of Cork's house in England was Stalbridge Park, Dorset, long since demolished. The garden here was laid out by the famous designer Isaac de Caus; see Grosart, Lismore Papers (1886), p64; HM Colvin, 'The south front of Wilton House', Arch. Jn., cxxi (1954), pp181-90.

The quincunx took two basic forms: the simplest had trees planted at the notional corners of a square, while the other more popular form had a fifth tree in the centre of the square, making a more complex pattern. Tree-spacing varied from fifteen to twenty-five feet.

Sir T Phillips, The view of the Survey of the Plantation of the City and County of Londonderry (PRONI, T.1576). A substantial portion of Dungiven bawn has been excavated, see NF Brannon and BS Blades, 'Dungiven bawn re-edified', Ulster Arch. Jn., 43 (1980), pp91-6; N Brannon, 'Archaeological excavations at Dungiven priory and bawn', Benbradagh, 15 (1985), pp15-18. A small trench was put into the garden site during the 1982 excavations, but nothing was recovered. Sadly, the area was subsequently planted with trees, so the potential for good garden archaeology here is very limited (N Brannon pers. comm.).

Earthworks are visible on aerial photographs in the Monuments and Buildings Record (EHS, Hill Street, Belfast)

Proposed 'plot' for the Merchant Taylor's house and bawn. Probably not completed in form depicted on this plan; TW Moody, The Londonderry Plantation 1609-41 (Belfast, 1939), p261, fig. 2

Bird's-eye view of Charlemont c.1630 (British Library, Add. Ms. 24200, f.39)

These fish ponds were for holding fish rather than breeding them. Similar ponds were a feature of other gardens of the period and may have been more common than we can appreciate on the basis of the present evidence. Examples included Old Bawn, county Dublin, Loughnane Castle, county Tipperary, and Lennagh, county Clare. The fish ponds within the walled enclosures at Newtownards, county Down, and Dalway's Bawn, county Antrim, may also be early 17th century. Fish ponds may also have been a regular features of medieval monastic precincts, examples being known at Cork Friary (Pat. Rolls James I, Pat. 13 (1) xxviii) and Fethard, county Tipperary (Pat. Rolls James I, Pat. 14 (3) iii). For an assessment of fish ponds, see CK Currie, 'Fishponds as garden features, c.1550-1750', Garden History, 18 (1990), pp22-46; CK Currie,
Medieval Fish, Fisheries and Fishponds (BAR, Oxford, 1988), series 182.

135 Monaghan and Castleblaney (Baie Loergan), plans c.1614 (TCD, Ms. 1209-32)
136 M Meek, Tully Castle Guide Card (DOE (NI), Belfast, 1984). The garden work, created
with plants known from this period, was supervised by Philip Wood of Enniskillen
on behalf of the Environment and Heritage Service.

It is relevant to note that such forecourts served as an outdoor extension to the hall,
traditionally a male preserve, where tenants and others would be received by the master
of the house. The earliest Irish depiction of such a court is a print c.1670 of
Ballintober, county Cork, see R Ffolliott, The Pooles of Mayfield and other Irish Families
(Hodges Figgis, Dublin, 1958), p150

The present garden ‘restoration’ in the front court of Portumna Castle owes more to a
vivid imagination than to historical or archaeological accuracy. The orchards and gar-
dens at Portumna in the 1630s flanked the east and south sides of the house and bawn,
while the west side overlooked the deer park, as at Mallow. No detailed study of the
Portumna layout has been published, but for some background on the house, see M

The gazon coupé was especially associated with gardens of the late 17th and early 18th
centuries.

140 W Brereton, Travels in Holland, the United Provinces, England, Scotland and Ireland,
1634-1635 (Chetham Society, Manchester, 1844), p127; Walker, ‘The rise and
progress of gardening in Ireland’, pp3-18. From 1625 to 1656, the post of Primate was
held by Archbishop James Usher, so presumably he was responsible for this ‘pretty neat
garden’. The use of the term ‘framed’ might imply that the letters, which one might
suppose were cut out of the grass, were all enclosed by a large surround of topiary.

141 Phillip’s town plan (NLI, Ms 3137-42)
142 Brereton, Travels, p127-8. The reference is to Thomas, first Baron Fairfax (1560-1640)
of Denton and Nunappleton, North Yorks.

———
THE BARRYSCOURT LECTURES

The Barryscourt Trust presents a series of bi-annual lectures on Medieval Ireland at Barryscourt Castle, Carrigtwohill, Co Cork

I
BARRYSCOURT CASTLE AND THE IRISH TOWER-HOUSE
Tadhg O'Keeffe

II
THE IMPACT OF THE ANGLO-NORMANS ON MUNSTER
AF O'Brien

III
TECHNOLOGICAL CHANGE IN ANGLO-NORMAN MUNSTER
Colin Rynne

IV
IRISH GARDENS AND GARDENING BEFORE CROMWELL
Terence Reeves-Smyth

V
OUTSIDE THE TOWER – RECENT EXCAVATIONS AT BARRYSCOURT
Dave Pollock

VI
BARRYSCOURT CASTLE REFURBISHED
Victor Chinnery
May 1999 (for publication: July 1999) ISBN 0946846 197

VII
LANDSCAPE AND SETTLEMENT IN EAST CORK, 1100-1700
Kieran O'Conor
October 1999 (for publication: December 1999) ISBN 0946846 197

For further details on the lecture series, contact:
The Barryscourt Trust, Barryscourt Castle, Carrigtwohill, Co Cork (tel 021-883864).

The Barryscourt lectures will be published individually, and a clothbound compilation will be published at three-yearly intervals. For further details on the publications, or to order copies, contact: Gandon Distribution Oysterhaven, Kinsale, Co Cork (tel 021-770830 / fax 021-770755).
